

IBM B.Tech Fresher Hiring 2025–2026

IBM's fresher hiring for B.Tech students is usually for roles like Associate Software Engineer / entry-level software roles, and the process commonly includes online assessment, technical interview, and HR interview. IBM's own careers pages emphasize coding, open source, and IBM Cloud as core themes for software engineering roles.

1) Hiring process

- Application / resume screening: Checks branch, CGPA, batch, backlog status, and project fit.
- Online assessment: Usually includes aptitude, coding, and sometimes communication/English sections.
- Technical interview: Tests DSA basics, OOPs, DBMS, OS, CN, projects, and problem-solving.
- HR interview: Tests communication, teamwork, motivation, and role fit.

2) Technical stack IBM hires for

IBM fresher roles commonly expect comfort with Java, Python, C++, and Node.js. IBM also highlights IBM Cloud and open-source work in its software engineering careers. SQL and database fundamentals are frequently relevant in technical interviews and assessments.

3) Recent news relevant for students

IBM's 2025–2026 news shows a stronger focus on AI, cloud, and software. At the same time, news reports in 2025 said IBM planned job cuts of about 2,700 to nearly 9,000 roles in some regions, which reflects restructuring rather than a broad entry-level hiring freeze. For students, the main takeaway is that IBM is still hiring freshers, but it is more selective and skill-driven.

4) Eligibility criteria

Most 2025–2026 fresher drives mention:

- CGPA: Usually 6.0 / 60% minimum.
- Backlogs: No active backlogs.[enggwave+1](#)
- Branches: Mostly CSE, IT, and related branches; some drives include wider CS-related specializations.[enggwave+1](#)
- Batch: Often 2024, 2025, and sometimes 2026 depending on the drive.[enggwaveyoutube](#)
- Package: Varies by role and drive, so avoid trusting a single fixed package number unless it comes from that specific opening.[ibm+1](#)

5) Five preparation tips for a 3rd-year student

1. Pick one language and get strong in it: Java or Python is safest for IBM-style drives.
2. Practice DSA daily: Arrays, strings, recursion, hashing, stacks, queues, and basic trees are enough to start.
3. Revise core CS subjects: OOPs, DBMS, OS, CN, and SDLC are common interview areas.
4. Build 1–2 project stories: Be ready to explain the problem, tech stack, your contribution, and challenges solved.
5. Prepare HR answers early: Why IBM, strengths, weaknesses, teamwork, and relocation are often asked.

Best way to focus

For IBM placement, the priority order should be: coding language → DSA → SQL → core CS → projects → mock interviews.
IBM's current hiring direction favors students who can show practical coding ability plus cloud or software-development familiarity.
